

Pedro Nadotti

Full-Stack Developer | 3rd-year CS Student at Insper

São Paulo, Brazil | +55 (19) 99845-8900 | nadottipedro5@gmail.com | [linkedin.com/in/pedro-nadotti](https://www.linkedin.com/in/pedro-nadotti) | github.com/Nadoutti

EDUCATION

Insper — Bachelor of Computer Science, GPA: 9.0/10

São Paulo, Brazil

Aug 2024 – Dec 2028 (expected)

PROFESSIONAL EXPERIENCE

Developer — Vault (crypto consulting startup)

São Paulo, Brazil

Dec 2025 – Jan 2026

- Built a full-stack feature from scratch for Vault's internal marketing team, working directly with the CTO in a lean team without a dedicated dev squad.
- Refactored parts of the codebase and standardized architectural patterns to align with the CTO's established conventions, improving consistency across the internal platform.

ACADEMIC PROJECTS

Project PO & Developer — Child and Youth Protection Network (UNAS)

São Paulo, Brazil

Sep 2025 – Oct 2025

- Led a team of 5 to build a communication platform (FastAPI backend, React/Vite frontend, Supabase database, Redis for messaging) for Conselho Tutelar de Heliópolis.
- Replaced manual, spreadsheet-based case-reporting workflows, saving ~3 hours of manual work per day and accelerating support for at-risk children and adolescents.

Project PO — Na Prática Project (Instituto Na Prática)

São Paulo, Brazil

Aug 2025 – Oct 2025

- Coordinated a team of 4 to build an [unofficial Tally SDK](#) after the official Tally API proved too limited for the institute's complex forms and integrations.
- Automation was adopted by Instituto Na Prática's internal team to streamline candidate screening for job applications, accelerating the hiring pipeline.

Developer — Fundação Lemann

São Paulo, Brazil

Nov 2024 – Dec 2024

- Built the React/Vite frontend from scratch and developed the SQL-based data pipeline for a platform transforming 10,000+ scattered WhatsApp messages into an interactive, social-network-style web application.
- Resolved a multi-day data-processing bottleneck to structure and surface historical message data at scale, as part of a team using Scrum and Design Thinking.

Developer — Raspibus

São Paulo, Brazil

May 2024 – Oct 2024

- Co-founded an independent accessibility project with a hardware-focused peer to help blind residents of São Paulo navigate public buses, informed by field research with ~30 visually impaired participants.
- Trained and adapted Ultralytics/PyTorch computer vision models to ~78% accuracy — sufficient given the model's continuous, low-stakes real-time predictions — on an augmented dataset (400 base images, expanded via rotation and transformation) to run on a Raspberry Pi.
- Secured ~R\$1,000 in early prototype funding and drew interest from a transportation-sector contact (former iFood employee) for a potential pilot with São Paulo's public transit system.

TECHNICAL SKILLS

Backend: Python (FastAPI, Flask, Celery), Node.js (NestJS), Go (Gin), REST APIs, SQL

Frontend: React, Next.js, Vite, TypeScript

ML & Data: PyTorch, Ultralytics, Computer Vision

Databases & Caching: PostgreSQL, Supabase, MongoDB, Redis

DevOps & Cloud: Docker, AWS (S3, SQS), CI/CD (GitHub Workflows), Git, Linux

Methodologies: Agile, Scrum, software architecture planning, team leadership

Languages: Portuguese (native), English (professional working proficiency)
